## What can we learn from IT: Is the UTAUT-model applicable to driver support systems?

*Emeli Adell*

## Likeness between driver support systems and IT applications

- New applications are incorporated in an existing interaction
- User interacts with a technology too complex to fully understand
- Information conveyed to the user seeks to facilitate an on-going task

## Differences between driver support systems and IT

	IT application	Driver support systems
--	----------------	------------------------

<b>Time</b>	Possibility of pausing and pondering	Short time span to make a decision
-------------	--------------------------------------	------------------------------------

## Differences between driver support systems and IT

	IT application	Driver support systems
--	----------------	------------------------

<b>Time</b>	Possibility of pausing and pondering	Short time span to make a decision
<b>Assistance with a process or a decision</b>	Assistance is normally available in some sort	Normally no assistance is available

## Differences between driver support systems and IT

	IT application	Driver support systems
<b>Time</b>	Possibility of pausing and pondering	Short time span to make a decision
<b>Assistance with a process or a decision</b>	Assistance is normally available in some sort	Normally no assistance is available
<b>Decision making and execution of decisions</b>	No continuous decision making or execution	Continuous decision making and execution

## Acceptance models used in the IT-area (Selection)

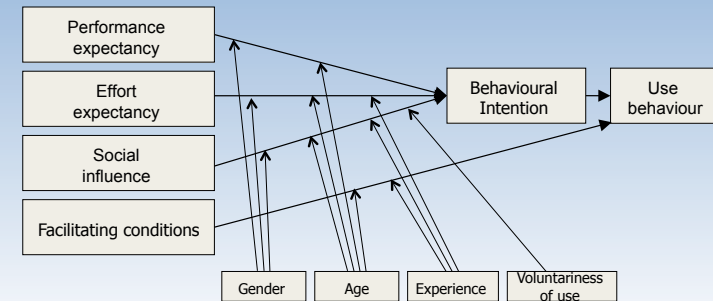

- The Pleasure, Arousal and Dominance paradigm (Mehrabian & Russell, 1974)
- **Theory of Reasoned Action (Ajzen & Fishbein, 1980)**
- Social Exchange Theory (Kelley, 1979, Emersson, 1987)
- **Technology Acceptance Model (TAM) (Davis, 1989)**
- **Theory of Planned Behaviour (TPB) (Ajzen, 1991)**
- **The Model of PC Utilization (Thompson et al 1991)**
- Social Influence Model (Fulk et al, 1990, and Fulk, 1993)
- **Motivational Model (Davis et al, 1992)**
- **Innovation Diffusion Theory (Rogers, 1995)**
- **Social Cognitive Theory (Compeau & Higgins, 1995)**
- **A combined model of TAM and TPB (Taylor and Todd, 1995)**
- Task technology fit (Goodhue & Thompson, 1995)
- System Implementation (Clegg, 2000)
- Three-Tier Use Model (Liaw et al, 2006)
- Social Identity Theory (e.g. Yang et al, 2007)

UTATU  
Venkatesh et al 2003

## The Unified Theory of Acceptance and Use of Technology (UTAUT)

- Based on eight of the most significant models the Unified Theory of Acceptance and Use of Technology (UTAUT) was proposed. (Venkatesh et al, 2003)
- Used also in other areas, such as:
  - Health sector
  - Adoption of mobile services among consumers

## The Unified Theory of Acceptance and Use of Technology (UTAUT)

### Definitions

Performance expectancy	"the degree to which an individual believes that using the system will help him/her to attain gains"
Effort expectancy	"the degree of ease associated with the use of the system"
Social influence	"the degree to which an individual perceives that important others believe he or she should use the new system"
Facilitating conditions	"the degree to which an individual believes that an organizational and technical infrastructure exists to support use of the system"

© Trivector Traffic AB

## Pilot test of the UTAUT-model

- **Data collected during evaluation of a prototype driver support system (SASPENCE)**
  - Field trials in Turin (It) and Valladolid (Es)
  - 40 randomly selected drivers
  - 50 km long route; urban, rural road and motorway section
  - Driver experiences and opinions collected by questionnaires

© Trivector Traffic AB

## Pilot test of the UTAUT-model

- The experimental design could not be modified
- The original model was applied as far as possible
- Test of part of the model

## Pilot test of the UTAUT-model

- Questions as similar to the original ones as possible
- Adapting items to the new context

Original Items (Venkatesh et al., 2003)	Modified Items
<b>Behavioural intention to use the system (BI):</b>	
Imagine that the system was on the market and you could get the system in your own car.	
BI1 I intend to use the system in the next <-> months	I would intend to use the system in the next 6 months
BI2 I predict I would use the system in the next <-> months	I would predict I would use the system in the next 6 months
BI3 I plan to use the system in the next <-> months	I would plan to use the system in the next 6 months
<b>Performance expectancy (PE):</b>	
PE1 I would find the system useful in my job	I would find the system useful in my driving
PE2 I think the system enables me to accomplish	I think the system enables me to react to

PE3	Using the system increases my productivity	Using the system increases my driving performance
PE4	If I use the system, I will increase my chances of getting a raise	If I use the system, I will decrease my risk of being involved in an accident

EE1 My interaction with the system would be clear and understandable	My interaction with the system would be clear and understandable
EE2 It would be easy for me to become skilful at using the system	It would be easy for me to become skilful at using the system
EE3 I would find the system easy to use	I would find the system easy to use
EE4 Learning to operate the system is easy for me	Learning to operate the system is easy for me
<b>Social influence (SI):</b>	
Imagine that the system was on the market and you could get the system in your own car.	Imagine that the system was on the market and you could get the system in your own car.
SI1 People who influence my behaviour would think that I should use the system	People who influence my behaviour would think that I should use the system
SI2 People who are important to me would think that I should use the system	People who are important to me would think that I should use the system
SI3 The senior management of this business has been helpful in the use of the system	The authority would be helpful in the use of the system
SI4 In general, the organization has supported the use of the system	In general, the authority would support the use of the system

## Pilot test of the UTAUT-model

- Factor analysis generally confirmed the assessment of the constructs

Factor/Variable	Component			
	1	2	3	4
BI 1			0.590	
BI 2			0.926	
BI 3			0.887	

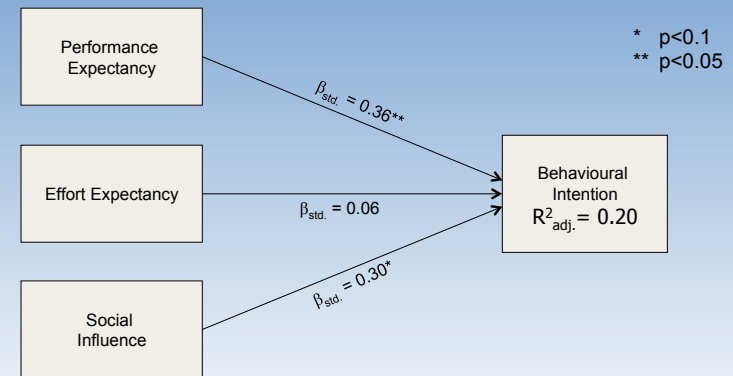

- However...

PE 3	0.858	0.044	0.124	0.261
PE 4	0.433	0.265	0.372	0.390

- Excluding item PE3 and PE4 from the construct “Performance Expectancy”

EE 1	0.659
EE 2	0.716
EE 3	0.917
EE 4	0.866
SI 1	0.693
SI 2	0.723
SI 3	0.687
SI 4	0.736

## Modifications to the UTAUT-model

## What can be learned from the IT acceptance work?

- Defines acceptance as the use of the technology
- Long history of modelling acceptance
- Many interesting models applied/developed
- The UTAUT
  - Performance Expectancy and Social Influence influenced the Intention to use
  - Effort Expectancy did not (unlike when applied to IT)
- Suggestions:
  - Add emotional reaction of the driver
  - Weigh the constructs by their perceived importance
  - Include system reliability
  - Further work on the assessment of constructs in the “new” environment

Emeli Adell  
Trivector Traffic AB

Adell, E. (2009) Driver experience and acceptance of driver support systems – a case of speed adaptation, Bulletin 251, Lund University

“Researchers are confronted with a choice among a multitude of models and find that they must “pick and choose” constructs across the models, or choose a “favoured model” and largely ignore the contributions from alternative models. Thus, there is a need for a review and synthesis in order to progress toward a unified view of user acceptance.”

Venkatesh et al. (2003)
